## Chapter 1 ADC Hardware Trigger Demo

This demo application demonstrates how to use the ADC drivers with different hardware triggers.

#### 1.1 Overview

This is an ADC demo application which shows how to use different hardware trigger sources to handle the ADC hardware trigger function. These trigger sources are supported:

- PIT (Periodic Interrupt Timer)
- PDB (Programmable Delay Block)
- LPTMR (Low Power Timer)

#### 1.1.1 Trigger by PIT

The Periodic Interrupt Timer (PIT) is a period timer source and the ADC hardware trigger event. Because the PIT trigger event can only be used to trigger one of the ADC channels (channel 0 or 1), this demo uses PIT as a trigger source for the ADCx channel 0. The PIT triggers the ADC in a fixed frequency and the demo gets the ADC conversion result in the ADC Conversion Complete (COCO) interrupt.

## 1.1.2 Trigger by PDB

The Programmable Delay Block (PDB) is a continuous trigger event for ADC. It uses the software trigger as the first trigger input event and turns on the PDB continuous mode to generate a period trigger source. Because the PDB can trigger different channels inside one ADC instance, this demo shows the Ping-Pong triggering which occurs by sampling the channel 0/1 with the PDB Pre-trigger A/B channel.

## 1.1.3 Trigger by LPTMR

The Low Power Timer (LPTMR) is a period timer source and the ADC hardware trigger event. Because the LPTMR trigger event can only be used to trigger one of the ADC channels (channel 0 or 1), this demo uses the LPTMR as a trigger source for the ADCx channel 0. The LPTMR triggers the ADC in a fixed frequency and the demo gets the ADC conversion result in the ADC Conversion Complete (COCO) interrupt.

### **Customization Options**

#### 1.1.4 Input signal for ADC

Use the DAC module to generate a sine wave as the ADC input on the DAC0\_OUT pin. Because the DAC0\_OUT is internally connected to the ADC0\_SE23 (DAC0\_OUT is a source of ADC0\_SE23), there is no need to connect any external signals for this demo.

This demo samples the input digital signal from the ADC0\_SE23 pin and records each sample point with the appropriate amplitude. After 2 period samples are complete, it prints out the rough shape of the signal wave on the debug console like a primitive oscilloscope.

### 1.2 Supported Platforms

These Freescale Freedom development platforms and Tower System modules are supported by the KSDK ADC Hardware Trigger demo.

• MAPS-K64

### 1.3 Getting Started

#### 1.3.1 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

#### 1.4 Run the demo

- 1. Select and open one project from the three projects available: adc\_pit\_trigger, adc\_lptmr\_trigger and adc\_pdb\_trigger.
- 2. Open the UART console on a PC.
- 3. Download and run the program on the target.
- 4. The signal waveform is displayed on the console.

## 1.5 Customization Options

This demo application is customizable to show different kinds of input signal waves.

#### 1.5.1 Default configurations

The configuration macro is located in the adc\_hw\_trigger.h header file.

#### 1.5.1.1 ADC configurations

- 1. Use ADC0 instance.
- 2. Use ADC\_SE23 input pin as sample pin.
- 3. Use VREFH/L as reference voltage.

#### 1.5.1.2 Sample frequency

The default sample rate is 20 Hz \* 100 / 2, which enables the demo application to get 100 samples per two periods. To change the sample rate, see the next section.

## 1.5.2 Configure the number of samples

Printing of the signal wave shape depends on the console size. A console can be 100x40. To get the best printing effect, align the number of samples to the console column numbers and convert the amplitude range to the [0, row - 1] range. The console column number should be same as sample numbers. Configuring the number of samples means configuring the console column size:

```
#define CHART_ROWS 30U // chart row for sampled data
#define CHART_COLS 100U // chart column for sampled data
#define NR_SAMPLES 100U // number of samples in one period
```

## 1.5.3 Configure the signal frequency

Change the following macro to configure the desired frequency in Hz units.

```
#define INPUT_SIGNAL_FREQ 20U // in Hz
```

## 1.5.4 Configure the ADC instance

Change the ADC\_INST macro to configure the ADC instance you want to use.

```
#define ADC_INST OU // ADC instance
```

## **Customization Options**

## 1.5.5 Configure the ADC input pin

If you do not use the DAC0\_OUT as a input signal, disable the macro in the project:

```
//#USE_DAC_OUT_AS_SOURCE
```

After disabling the DAC output, configure one ADC input source pin to get the signal:

#define ADC\_INPUT\_CHAN 23U // default input signal channel

## Chapter 2 ADC Low Power Demo

This demo application demonstrates how to use the ADC drivers in low power modes.

#### 2.1 Overview

The ADC Low Power Demo project is a demonstration program that uses the KSDK software. The microcontroller is set to a very low power stop (VLPS) mode, and every 500 ms an interrupt wakes up the ADC module and takes the current temperature of the microcontroller. While the temperature remains within boundaries, both LEDs are off. If the temperature is higher than average, a red LED comes on. If it is lower, a blue LED comes on. This demo provides an example to show how ADC works during a VLPS mode and a simple debugging, "golden" project.

## 2.2 Supported Platforms

These Freescale Freedom development platforms and Tower System modules are supported by the Kinetis software development kit ADC Low Power demo.

• MAPS-K64

## 2.3 Getting Started

The ADC Low Power project is designed to work with the Tower System or in a stand alone setting.

## 2.3.1 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - · No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

## **Getting Started**

#### 2.3.2 Run the demo

- 1. Set your target board in a place where the temperature is constant.
- 2. Press the reset button on your development board.
- 3. "ADC LOW POWER DEMO" message and some instructions should be displayed on the terminal.
- 4. Wait until the red or white LED light turns on.
- 5. Increment or decrement the temperature to see the changes.

## Chapter 3 DAC Potentiometer Demo

This demo application demonstrates how to sample the voltage output by the potentiometer.

#### 3.1 Overview

This application demonstrates how to configure the ADC as Single-End mode and differential mode and sample the voltage output by the potentiometer.

### 3.2 Supported Platforms

• MAPS-K64

## 3.3 Getting Started

### 3.3.1 Hardware Settings

This table shows the connections that are required for the supported platforms:

Platform	Jump Setting
MAPS-K64	JP10 1-2
WAI 5-K04	JP11 1-2

## 3.3.2 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see the User's Guide for your board.

#### 3.4 Run the demo

1. Power on the boards, download the application into Flash, and run.

- 2. Open the PC console to connect to the board.
- 3. When successfully connected, the output is like as follows:

```
Potentiometer demo start...

Select Potentiometer mode:

1: Potentiometer -- Single End(RV2).

2: Potentiometer -- Single End(RV1)JP10 connect first).

3: Potentiometer -- Difference.

Please enter your choice (1 - 3):
```

4. select the choice, then the voltage sampled would output to the console, like this "voltage: 3.2984V". If the choice is not 1, 2 and 3, the "Invalid choice." would be output to the console.

## Chapter 4 DAC Speaker Demo

This demo application demonstrates how to control the speaker by DAC output.

#### 4.1 Overview

This application demonstrates how to configure the DAC and set the output on the DAC to control the sound of speaker.

## 4.2 Supported Platforms

• MAPS-K64

## 4.3 Getting Started

## 4.3.1 Hardware Settings

This table shows the connections that are required for the supported platforms:

Platform	Jump Setting
MAPS-K64	JP18 1-2

## 4.3.2 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see the User's Guide for your board.

#### 4.4 Run the demo

- 1. Power on the boards, download the application into Flash, and run.
- 2. Open the PC console to connect to the board.

3. When successfully connected, the output is like as follows:

```
DAC output to control the sound of speaker. Input value (0--2047):
```

4. Input the value, for example: 1024, then the speaker will sound. Input the different value, then the loud of speaker is different.

## Chapter 5 DSPI eDMA Demo

This demo application demonstrates how to use the DSPI and eDMA drivers.

#### 5.1 Overview

This application demonstrates how to configure the DSPI transfers using eDMA in both send and receive modes.

## 5.2 Getting Started

## 5.2.1 Hardware Settings

Make these connections between the signals listed by using external wires. This demo uses the same board for both master and slave connections.

#### MAPS-K64:

	Master		Connects To	Slave	
Signal	Pin Name	Board Location		Pin Name	Board Location
SS	PTD0	CN8 - 15	->	PTB10	CN9 - 11
SCK	PTD1	CN8 - 16	->	PTB11	CN9 - 12
Data In	PTD2	CN8 - 17	->	PTB17	CN9 - 14
Data Out	PTD3	CN8 - 18	->	PTB16	CN9 - 13

## 5.2.2 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with the following settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - · No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

#### 5.3 Run the demo

This output appears in the terminal window:

#### The user enters the desired bit rate when this prompt appears:

```
Enter a SPI clock frequency between 3,000 Hz & 2,000,000 Hz below. NOTE: If the number is less than 1,000,000 press enter after typing the number.
```

->

Upon successful completion of the demo this message appears in the terminal window:

```
Demo Complete.

128 loops completed.

g_slaveRxBuffer
```

00000123	00004567	000089AB	0000CDEF

Final value of  $g_slaveTxCount sent: 0x7F$ 

Success! The Master received all the bytes from the slave correctly.

Freescale Semiconductor 13

#### **Key Functions**

End of demo.

## 5.4 Key Functions

## void dspi\_edma\_master\_setup(uint8\_t instance, uint32\_t baudRateHz, uint8\_t transferSize-Bits)

This function takes in the DSPI module instance, the desired data rate of DSPI transfers, the frame size of the data transfer, and initializes the DSPI master instance.

#### **Parameters**

instance	DSPI module instance
baudRateHz,	Pass in the desired baud rate of DSPI transfers in Hz.
transferSizeBits	Pass data frame size (8 or 16 bit)

#### void dspi\_edma\_slave\_setup(uint8\_t instance, uint8\_t transferSizeBits)

This function takes in the DSPI module instance, the frame size of the data transfer, and initializes the DSPI slave instance.

#### **Parameters**

instance	DSPI module instance
transferSizeBits	Pass data frame size (8 or 16 bit)

#### dspi\_status\_t data\_source(uint8\_t \* sourceWord, uint32\_t instance)

This is a callback function for the DSPI slave which transmits data from the slave. In this application, the function generates the slave data out which is a count.

#### **Parameters**

sourceWord	8-bit data variable to be passed to slave PUSHR register.
instance	Instance of the DSPI module.

#### void on\_error(dspi\_status\_t error, uint32\_t instance)

This is a callback function for the DSPI slave which handles errors. In this application, the function sets the error flag to signal the end of the demonstration.

#### **Parameters**

error	Uses dspi_status_t value given by driver interrupt handler.
instance	Instance of the DSPI module.

#### void setup\_edma\_loop(edma\_loop\_setup\_t \*loopSetup, uart\_state\_t \*uart)

This function configures an eDMA transfer loop by using a loopSetup structure. If a valid uart\_state\_t is passed, the function prints out the TCD for that loop.

#### **Parameters**

loopSetup	Data structure defined by user containing all parameters for the eDMA loop.
uart	Pointer to a valid uart_state_t for debug printing.

#### void disable\_edma\_loop(edma\_loop\_setup\_t \*loopSetup, uart\_state\_t \*uart)

This function disables the user-configured eDMA transfer loop. It also frees memory allocated by the eDMA transfer loop. If a valid uart\_state\_t is passed to it, it prints out the TCD for that loop.

#### **Parameters**

loopSetup	Data structure defined by user containing all parameters for the eDMA loop.
uart	Pointer to a valid uart_state_t for debug printing.

#### void \*mem\_align(size\_t ptrSize, uint32\_t alignment)

This function performs the aligned data memory allocation and is useful when the mem\_align is not available.

#### **Parameters**

ptrSize	size_t variable to pass size of memory to be allocated
alignment	uint32_t variable to pass byte size to align data with

#### Returns

pointer to aligned & allocated memory

#### void free\_align(void \*ptr)

This function frees the memory allocated by the mem\_align.

## MAPS-K64 Demo Applications User's Guide

Freescale Semiconductor 15

## **Key Functions**

## Parameters

ptr Pointer that has been allocated with the mem\_align.

## Chapter 6 SPI LCD Demo

This demo application demonstrates how to use lcd12864 by SPI interface.

#### 6.1 Overview

The dspi\_lcd demo project shows how to use lcd12864 by SPI. The lcd12864 controller is ST7565S.

### 6.2 Supported Platforms

These Freescale Freedom development platforms and Tower System modules are supported by the KSDK Flash demo.

• MAPS-K64

## 6.3 Getting Started

The Dspi\_lcd Demo example code shows how to use lcd12864 through SPI interface.

## 6.3.1 Prepare the Demo

- 1. Download the program to the target board.
- 2. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

#### 6.3.2 Run the demo

- 1. Download and run the dspi\_lcd code to the board.
- 2. See if the char can be display on lcd successful.

**Getting Started** 

## Chapter 7 I2C EEPROM Demo

This demo application demonstrates how to use I2C driver to communicate with AT24C02 EEPROM.

#### 7.1 Overview

This is a EEPROM communication demo which demonstrates the communication between MCU with EEPROM IC AT24C02. The demo will write data into 256 bytes space in the EEPROM chip and then read it back.

## 7.2 Supported Hardware

This MAPS-K64 board is supported by the KSDK EEPROM demo.

• MAPS-K64

### 7.3 Getting Started

#### 7.3.1 Hardware configuration

Running this demo requires both MAPS-K64 and MAPS-DOCK board connected together.

MAPS-DOCK module configuration

1. Short JP4(1-2), J4(3-4) to enable I2C connection.

## 7.3.2 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - · No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

## 7.4 Run the demo

1. For a successfully run, the read back data is the same as write data. If there is error communication with I2C, then you will see write and read error messages.

## Chapter 8 Flash Demo

This demo application demonstrates how to use the Flash drivers.

#### 8.1 Overview

The Flash demo project shows how to erase, program, and performs swap (if available) on the Flash module. Targets exist for both Flash and SRAM memory space. The features include:

- 1. Full Flash erase and programming support
- 2. Flash Erase by block or sector, including margin read options
- 3. Programming region defined by user
- 4. Flash verify and checksum support
- 5. Flash Swap (if supported on device)

### 8.2 Supported Platforms

These Freescale Freedom development platforms and Tower System modules are supported by the KSDK Flash demo.

- FRDM-K22F
- FRDM-K64F
- TWR-K22F120M
- TWR-K64F120M
- TWR-KV31F120M

## 8.3 Getting Started

The Flash Demo example code shows how to erase and program the Flash content and use the swap feature if it is supported on the device.

## 8.3.1 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - No flow control
- 3. Download the program to the target board.

#### **Commands/Directions**

4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

#### 8.4 Commands/Directions

- 1. Select the Debug target from within the IDE and build the project selected for the target hardware. The default Debug target runs from flash and demonstrates the Swap feature for devices that support Swap (K64F).
- 2. Connect one end of the USB cable to a PC host and the other end to the OpenSDA connector on the board.
- 3. Open Terminal program such as TeraTerm, Putty, or Hyperterminal.
- 4. Configure the Terminal program to select the OpenSDA COMx port for the board using 115200 8N1: 115200 baud, 8 data bits, No parity, 1 Stop bit.
- 5. Connect to the board with the debugger (download & debug), run the program, and view the Terminal messages for Flash operations being performed.
- 6. For devices that support Swap, the Flash\_Debug target copies (programs) the application that is running from the lower block to the upper block and then issues swap commands.
- 7. Flash memory blocks are swapped at the next reset. Disconnect debug session and hit the reset button on the board. Note: During swap, memory locations 0x7F000 & 0xFF000 are swapped and displayed on the terminal showing how the memory map changes.
- 8. For devices that do not support swap, view the terminal messages for Flash operations that are occurring for the demo.
- 9. Terminal displays the message "Flash Demo Complete!" when finished.
  - Note: Callback functions are not currently supported during flash erase or program operations Note: For K22F, Flash erase and program operations are not allowed in High-Speed RUN modes. Therefore, the core clock speed is restricted to 80 MHz or less.

## Chapter 9 FlexBus LCD Demo

This demo application demonstrates how to use lcd(ILI9341) by FlexBus.

#### 9.1 Overview

The flexbus\_lcd demo project shows how to use lcd(ILI9341) by FlexBus.

## 9.2 Supported Platforms

These Freescale Freedom development platforms and Tower System modules are supported by the KSDK Flash demo.

• MAPS-K64

### 9.3 Getting Started

The Dspi\_lcd Demo example code shows how to use lcd(ILI9341) through flexbus interface.

## 9.3.1 Prepare the Demo

- 1. Download the program to the target board.
- 2. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

#### 9.3.2 Run the demo

- 1. Download and run the dspi\_lcd code to the board.
- 2. See if the picture can be display on lcd successful.

**Getting Started** 

## Chapter 10 FlexCAN and UART communication Demo

This demo application demonstrates how to use the FlexCAN and UART drivers.

#### 10.1 Overview

This is a FlexCAN and UART communication demo which demonstrates the communication between two boards which is handled by FlexCAN and the UART input/output. On one board, the user inputs characters by using the UART debug terminal and sends the data with the FlexCAN interface. On the other board, the FlexCAN receives the data and prints them to the UART terminal.

## 10.2 Supported Hardware

This Tower System module is supported by the KSDK FlexCAN and UART demo.

• MAPS-K64

## 10.3 Getting Started

### 10.3.1 Hardware configuration

1. Connect the two CAN modules through the CAN port CN13(Dock board).

## 10.3.2 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - · No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

#### 10.4 Run the demo

- 1. Select the node ID for each board by typing A/a or B/b followed by Enter.
- 2. You may now transfer characters by using serial terminals. For more details, see the video in the //video folder.

# Chapter 11 FlexTimer PWM Demo

This demo application demonstrates the FlexTimer PWM demo.

#### 11.1 Overview

This application demonstrates the FTM edge-aligned PWM function. It outputs the PWM to control the intensity of the LED.

# 11.2 Supported Platforms

These Freescale Freedom development platforms and Tower System modules are supported by the KSDK FlexTimer demo.

• MAPS-K64

## 11.3 Getting Started

## Hardware configuration

This table lists which FTM channels and MCU pins control for this demo application. This table also lists which connections should be made (if any) to ensure proper demo operation.

Platform	FTM Instance/Chnl	MCU Pin	
MAPS-K64	FTM0 - CH4	PTA7	

NOTE: The FRDM-K64 requires an external jumper wire to make the appropriate connections.

# 11.3.1 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with the following settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - No flow control
- 3. Download the program to the target board.
- 4. Find Pin PTA7 and connect to the oscilloscope.
- 5. Either press the reset button on your board or launch the debugger in your IDE to begin running the

# **Getting Started**

demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

## 11.3.2 Run the demo

- 1. Download and run the ftm\_pwm code to the board.
- 2. Terminal prints the message "Welcome to FTM PWM demo!"
- 3. Capture Pin PTA7 waveform and check the PWM pulse width changes.

# Chapter 12 Hello World Demo

This demo application demonstrates the Hello World demo.

#### 12.1 Overview

The Hello World project is a simple demonstration program that uses the KSDK software. It prints the "Hello World" message to the terminal using the KSDK UART drivers. The purpose of this demo is to show how to use the UART and to provide a simple project for debugging and further development.

## 12.2 Supported Platforms

These Freescale Freedom development platforms and Tower System modules are supported by the KSDK Hello World demo.

- FRDM-K22F
- FRDM-K64F
- TWR-K22F120M
- TWR-K64F120M
- TWR-KV31F120M

# 12.3 Getting Started

# 12.3.1 Hardware Settings

The Hello World project does not call for any special hardware configurations. Although not required, the recommendation is to leave the development board jumper settings and configurations in default state when running this demo.

# 12.3.2 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - · No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

## **Communication Interface Settings:**

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

## 12.4 Run the demo

This is an example how to run the demo.

Hello World!

# 12.5 Communication Interface Settings:

This part provides the information to customize the Hello World demo. The Hello World demo is configured to use these port pins for the platforms by default. If applicable for the board, jumpers are specified to select between serial output via OpenSDA and serial output via TWR-SER.

Platform	TX MCU Pin (Board	RX MCU Pin (Board	<b>Module Instance</b>
FRDM-K22F	Pin) PTE0 (N/A)	Pin) PTE1 (N/A)	UART1
FRDM-K64F	PTB17 (N/A)	PTB16 (N/A)	UART0
TWR-K22F120M	PTE0 (J30)	PTE1 (J29)	UART1
TWR-K64F120M	PTC4 (J15)	PTC3 (J10)	UART1
TWR-KV31F120M	PTB17 (J23)	PTB16 (J22)	UART0

# 12.5.1 Customization Options

The USE\_STDIO\_FUNCTIONS define determines if the demo uses standard I/O functions, such as printf. If it is not defined, then the demo accesses the UART driver directly.

# Chapter 13 Hardware Timer Demo

This demo application demonstrates using the hardware timer driver.

#### 13.1 Overview

The Hardware Timer project is a demonstration program to show how to use the Hardware Timer driver. An hwtimer interrupt is created and fires multiple times until it reaches the requested number.

## 13.2 Supported Platforms

These Freescale Freedom development platforms and Tower System modules are supported by the Kinetis SDK Hardware Timer demo.

• MAPS-K64

# 13.3 Getting Started

## 13.3.1 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with the following settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - · No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

### 13.3.2 Run the demo

- 1. Press the reset button on your board.
- 2. "Hwtimer Example" message is displayed on the terminal.
- 3. A dot is printed when an hwtimer interrupt occurs until the HWTIMER\_DOTS\_PER\_LINE \* HW-TIMER\_LINES\_COUNT (defined in hwtimer\_demo.c) interrupts occur.
- 4. Finally, the "End" message is displayed.

Hwtimer Example

# **Customization Options**

# 13.4 Customization Options

This demo application is customizable to show different types of hardware timers.

# 13.4.1 Configure the Hardware Timer Used

Determine which timer the hardware timer driver uses. The ARM core systick timer is used by default.

```
#define HWTIMER_LL_DEVIF kSystickDevif
```

## 13.4.2 Configure which clock is used by the hardware timer

Determine which clock source is used by the hardware timer.

```
#define HWTIMER_LL_SRCCLK kCoreClock
```

## 13.4.3 Configure which instance of the module is used

Determine which instance of the selected hardware module to use. For the systick timer only '0' is valid. If the PIT is used, use this to select the PIT channel.

```
#define HWTIMER_LL_ID 0
```

### 13.4.4 Hardware Timer Period

Determine the timer period (in microseconds).

```
#define HWTIMER_PERIOD 100000
```

# Chapter 14 I2C Demo with RTOS

This demo application demonstrates the I2C demo on different RTOS.

### 14.1 Overview

This I2C application demonstrates the SDK Peripheral drivers working on different RTOSes. The application acts as both the I2C master and the slave device on different I2C buses, such as the I2C Master on the I2C0 bus and the I2C Slave on the I2C1 bus. It can run on a single board or on two different boards. When connecting the two I2C buses on one board, the master sends the command using the I2C0 bus to the slave using the I2C1 bus. When connecting the I2C0 bus to the I2C1 bus on the other board, the application running on the first board is a master and sends a command to the other board which acts as a slave. This means that the first board can send a command and get a response from the other board by using the I2C bus. The basic purpose of this demo is:

- 1. Read the Kinetis chip UID (low 32bits) from the slave board
- 2. Read the Kinetis chip internal temperature from the slave board
- 3. Control the LEDs on the slave board

The application creates three different tasks to handle events concurrently:

- 1. Master task: responds to the user interface interaction, runs as a I2C master, and acts as a simple UI. It accepts user's commands to read the basic chip UID, chip temperature and control the on board LED, and power mode on the slave.
- 2. Slave task: responds to the command received from the I2C master and returns the result to the master.
- 3. ADC sample task: responds to getting the chip temperature in a period.
- 4. For the bare metal version, the master and slave tasks are separated into two separate projects.

# 14.2 Supported RTOS

- Freescale MQX<sup>TM</sup> RTOS
- FreeRTOS
- μC/OS-II
- μC/OS-III
- Bare Metal (no RTOS)

# 14.3 Supported Platforms

These Freescale Freedom development platforms and Tower System modules are supported by the KSDK I2C demo with RTOS.

• MAPS-K64

## 14.4 Getting Started

The I2C RTOS application is designed to work on one single board or two different boards. Note that the bare-metal version only supports two boards.

## 14.4.1 Build with different RTOS support

Before running this application, build it with the RTOS you want to use. The projects for different RT-OSes are differentiated by the workspace file name in the format of i2c\_rtos\_<rtos>.eww For example, in IAR, the i2c\_rtos\_ucosii.eww workspace file is the  $\mu$ C/OS-II version of this application. After opening the appropriate workspace, build the ksdk\_<rtos>\_lib project and build the application project. A binary named i2c\_rtos>\_cut is generated.

## 14.4.2 Hardware configuration

Make the connections between the listed signals by using the external wires.

#### Freescale MAPS-K64

Shunt JP1 on MAPS-DOCK for I2S signals Shunt JP4 on MAPS-DOCK for I2C signals

## 14.4.3 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - · No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

#### 14.5 Run the demo

This menu displays in the terminal window:

1 - LED One Toggle - LED1 toggles on/off 2 - LED Two Toggle - LED2 toggles on/off 3 - LED Three Toggle - LED3 toggles on/off 4 - LED Four Toggle - LED4 toggles on/off 5 - Read Temperature - Get

temperature of client 6 - Read Id - Read client unique id Please enter your choice (1 - 6): Enter your choice (1 - 5):

You can select to toggle the LEDs, read the temperature of the client board, and read the client unique ID.

Freescale Semiconductor 35

# Chapter 15 LPTMR Demo

This demo application demonstrates the LPTMR demo.

#### 15.1 Overview

The LPTMR (Low Power Timer) project is a simple demonstration program to show how to use the LPT-MR driver. It triggers an LPTMR interrupt once every second, and prints out the number of interrupts that have occurred since the program started running.

## 15.2 Supported Platforms

This demo supports the following Freescale Freedom development platforms and Tower System modules:

MAPS-K64

## 15.3 Getting Started

# 15.3.1 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with the following settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

## 15.4 Run the demo

An LPTMR interrupt occurs every second and prints out to the serial terminal the number of interrupts that have occurred since the program started running. The LPTMR module uses the internal 1 kHz Low Power Oscillator (LPO) as its clock source for this demo.

The output on the serial terminal is as shown:

Low Power Timer Example Started LPTMR 1 2 3 4 5 6 7

Freescale Semiconductor 37

# Chapter 16 HTTP Server Demo on IwIP TCP/IP Stack

This demo application demonstrates the HTTPServer demo on lwIP TCP/IP stack with bare metal SDK or different RTOSes.

### 16.1 Overview

This is an HTTPServer set up on lwIP TCP/IP stack with bare metal SDK or different RTOSes. The user uses an Internet browser to send a request for connection. The board acts as an HTTP server and sends a Web page back to the PC.

## 16.2 Supported RTOS

- Freescale MQX<sup>TM</sup> RTOS
- FreeRTOS
- μC/OS-II
- μC/OS-III
- Bare Metal (no RTOS)

# 16.3 Getting Started

See the *lwIP TCPIP Stack and Kinetis SDK Integration User's Guide* (document KSDKLWIPUG) for more information about the setup and requirements.

# 16.3.1 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with the following settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - · No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions steps, see a Kinetis SDK User's Guide for your board.

## **Getting Started**

# 16.3.2 Network Configuration

Configure the IP address of PC network adapters as shown: IP address - 192.168.2.100 Subnet Mask - 255.255.255.0

### 16.3.3 Run the demo

- 1. Download the program to target board, which should be installed in TWR or FRDM.
- 2. Connect the Ethernet cable between the PC and the board.
- 3. When successfully connected, reset the board to run the demo.
- 4. Open the PC command window, type in "ping 192.168.2.102" to test whether lwIP stack is running. If successful,
  - four echo request packets are successfully replied.
- 5. Input "192.168.2.102" in the URL of an Internet browser on a PC. If successful, the web page the board returns opens in the browser.

# Chapter 17 Ping Demo on IwIP TCP/IP Stack

This demo application demonstrates the Ping demo on lwIP TCP/IP stack with bare metal SDK or different RTOSes.

### 17.1 Overview

This is a Ping Demo on the lwIP TCP/IP stack which uses the ICMP protocol. The application on board periodically sends the ICMP echo request to a PC and processes the PC reply. Type the "ping \$board\_address" in the PC command window to send an ICMP echo request to the board. The lwIP stack sends the ICMP echo reply back to the PC.

# 17.2 Supported RTOS

- Freescale MQX<sup>TM</sup> RTOS
- FreeRTOS
- µC/OS-II
- μC/OS-III
- Bare Metal (no RTOS)

# 17.3 Getting Started

See the *lwIP TCPIP Stack and Kinetis SDK Integration User's Guide* (document KSDKLWIPUG) for instructions and requirements.

# 17.3.1 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

# 17.3.2 Network Configuration

Configure the IP address of PC network adapters as shown:

• 192.168.2.100

### 17.4 Run the demo

- 1. Download the program to the target board.
- 2. Connect the Ethernet cable between the PC and the board.
- 3. When successfully connected, reset the board to run the demo.
- 4. Open the terminal. Ping send and ping receive are successful.
- 5. Type in "ping 192.168.2.102" in PC command window. If the operation is successful, four packets are
  - successful replied.

# Chapter 18 TCP Echo Demo on lwIP TCP/IP Stack

This demo application demonstrates the TCP Echo demo on lwIP TCP/IP stack with bare metal SDK or different RTOSes.

### 18.1 Overview

This is a TCP echo demo on the lwIP TCP/IP stack with bare metal SDK or different RTOSes, which uses the TCP protocol and acts as an echo server. The application on board sends back the TCP packets from the PC, which can be used to test whether the TCP connection is available.

## 18.2 Supported RTOS

- Freescale MQX<sup>TM</sup> RTOS
- FreeRTOS
- μC/OS-II
- μC/OS-III
- Bare Metal (no RTOS)

# 18.3 Getting Started

See the *lwIP TCPIP Stack and Kinetis SDK Integration User's Guide* (document KSDKLWIPUG) for instructions and requirements.

# 18.3.1 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - · No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

# 18.3.2 Network Configuration

Configure the IP address of PC network adapters as shown:

• 192.168.2.100

## 18.4 Run the demo

- 1. Download the program to the target board.
- 2. Connect the Ethernet cable between the PC and the board.
- 3. When successfully connected, reset the board to run the demo.
- 4. Open the command window on PC, type in "ping 192.168.2.102" to test whether the LwIP is running.
- 5. If it is running, use an external echo tool to perform the echo request. This tool sends TCP packets to the board and checks whether the content sent back from board is the same. A similar tool named "echotool" can be downloaded from the: http://bansky.net/echotool/ [example: echotool 192.168.2.102 /p tcp /r 7 /d hello]
- 6. If the operation is successful, all packets sent back are same as the packets sent to the board.

# Chapter 19 UDP Echo Demo on IwIP TCP/IP Stack

This demo application demonstrates the UDP Echo demo on lwIP TCP/IP stack with bare metal SDK or different RTOSes.

### 19.1 Overview

This is a UDP echo demo on the lwIP TCP/IP stack with bare metal SDK or different RTOSes, which uses the UDP protocol and acts as an echo server. The application on board sends back the UDP packets from the PC, which can be used to test whether the UDP connection is available.

## 19.2 Supported RTOS

- Freescale MQX<sup>TM</sup> RTOS
- FreeRTOS
- μC/OS-II
- µC/OS-III
- Bare Metal (no RTOS)

# 19.3 Getting Started

See the *lwIP TCPIP Stack and Kinetis SDK Integration User's Guide* (document KSDKLWIPUG) for instructions and requirements.

# 19.3.1 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - · No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

# 19.3.2 Network Configuration

Configure the IP address of PC network adapters as shown:

• 192.168.2.100

### 19.4 Run the demo

- 1. Download the program to the target board.
- 2. Connect the Ethernet cable between the PC and the board.
- 3. When successfully connected, reset the board to run the demo.
- 4. Open the command window on PC, type in "ping 192.168.2.102" to test whether the lwIP is running.
- 5. If it is running, use an external echo tool to perform the echo request. This tool sends UDP packets to the board and checks whether the content sent back from board is the same. A similar tool named "echotool" can be downloaded from the: http://bansky.net/echotool/ [example: echotool 192.168.2.102 /p udp /r 7 /d hellol
- 6. If the operation is successful, all packets sent back are the same as the packets sent to the board.

# Chapter 20 RTC Function Demo

This demo application demonstrates how to use the RTC driver.

#### 20.1 Overview

This RTC demo application demonstrates the important features of the RTC Module by using the RTC Periperhal Driver. It supports these features:

- Calendar
  - Get the current date time with Year, Month, Day, Hour, Minute and Second.
  - Set the current date time with Year, Month, Day, Hour, Minute and Second.
- Alarm
  - Set the alarm based on the current time.
  - Application prints a notification when the alarm expires.
- Seconds interrupt
  - Use second interrupt function to display a digital time blink every second.
- Compensation
  - Configure the compensation with cycles.
  - The 1 Hz RTC clock with compensation configured is output to a pin. Use an oscilloscope to check the compensation result.

# 20.2 Supported Hardware

These Freescale Freedom development platforms and Tower System modules are supported by the KSDK RTC Function demo.

- FRDM-K22F
- FRDM-K64F
- TWR-K22F120M
- TWR-K64F120M

# 20.3 Getting Started

# 20.3.1 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with the following settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - No flow control

Freescale Semiconductor 47

- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

# 20.4 Run the demo

This menu is displayed on the serial terminal:

```
Please choose the sub demo to run:

1) Get current date time.

2) Set current date time.

3) Alarm trigger show.

4) Second interrupt show (demo for 20s).

5) Set RTC compensation.

Select:
```

# Chapter 21 SAI Demo

This demo application demonstrates how to use the SAI drivers to communicate with WM8960 audio codec.

#### 21.1 Overview

The SAI Demo project is a digital audio demonstration program that uses the KSDK software. It performs audio playback from either a .wav file, stored in Flash.

## 21.2 Supported Hardware

This demo supports the following Freescale Freedom development platforms and Tower System modules:

• MAPS-K64

# 21.3 Getting Started

## 21.3.1 Hardware Settings

MAPS-K64 and MAPS-DOCK modules are required to run the sai\_demo.

# 21.3.2 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

#### 21.4 Run the demo

To hear the audio playback, connect a set of headphones to the headphone output on the MAPS-DOCK board CN10.

When the demo starts, this message is displayed in the terminal output window:

# **Key Functions**

```
Audio Demo!

Press spacebar to start demo.

Demo begin...
```

The user can select play back a .wav file stored in the Flash.

The user is prompted to select from a list of headphone output levels:

Choose headphone dB level:

- 1. 0.0 dB
- 2. -3.0 dB
- 3. -6.0 dB
- 4. -12.0 dB
- 5. -24.0 dB

# 21.5 Key Functions

void audio\_wav\_init(wave\_file\_t \*newWav)

Initializes the I2S, I2C, and TWR-DOCK Tower System module for playing back WAV file

**Key Functions** 

# uint32\_t config\_volume(sgtl\_handler\_t \*handler, sgtl\_module\_t module, uint32\_t volumeCtrl)

Sets volume from the user input.

#### Parameters

handler & pointer to codec handler structure.

module & name of module on codec to set the volume for.

volumeCtrl & user input data from terminal menu.

Returns

status\_t Return kStatus\_Success if function completed successfully, return kStatusFai

## snd\_status\_t get\_wav\_data(wave\_file\_t \*waveFile)

Collects data from WAV file header.

#### Parameters

waveFile & Data structure of pcm data array.

Returns

status\_t Return kStatus\_Success if function completed successfully, return kStatusFai

MAPS-K64 Demo Applications User's Guide

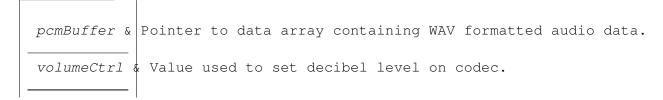

Freescale Semiconductor 51

## **Key Functions**

# snd\_status\_t play\_wav(uint32\_t \*pcmBuffer, uint8\_t volumeCtrl)

Plays the PCM audio data from the WAV format array.

#### Parameters

#### Returns

status\_t Return kStatus\_Success if function completed successfully, return kStatusFai

## void send\_wav(uint8\_t \*dataBuffer, uint32\_t length, sai\_data\_format\_t \*dataFormat)

Sends audio data to the sound card.

#### Parameters

```
pdataBuffer & Pointer to data array containing WAV formatted audio data.

length & length of WAV file to send.

dataFormat & Point to audio_data_format_t for sound card.
```

# Chapter 22 SD Card Demo

This demo application demonstrates the SD Card demo.

### 22.1 Overview

The SD Card demo application demonstrates the use of SD card driver. It displays the card information followed by a write-read compare test and the erase operation.

## 22.2 Supported Hardware

These Freescale Freedom development platforms and Tower System modules are supported by the KSDK SD Card demo.

• MAPS-K64

## 22.3 Getting Started

## Hardware configuration

There is no specific hardware requirement. The default configuration of the supported targets is sufficient for this demo. The demo uses the on-board connector support for the card detect signal which is connected to a GPIO line for card detection.

# 22.3.1 Prepare the Demo

- 1. Connect the RS232 serial port (CN7) to PC host.
- 2. Open a serial terminal with the following settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

#### 22.4 Run the demo

1. Insert an SD or a micro-SD card depending on the connector on board. Ensure that the card doesn't contain any important content because the demo will erase and overwrite some sectors.

- 2. After the card detection, the card-specific information, such as capacity, is shown. Then, the user is encouraged to back up data as needed. A write-read-compare access is performed to demonstrate the use case.
- 3. If the card was not inserted as mentioned in step 1, the demo waits for the card insertion. Once a card is inserted, it auto-detects and proceeds as shown in step 3.

# Chapter 23 SPI Flash Demo

This demo application demonstrates the access to the SPI flash.

#### 23.1 Overview

This demo application provides simple menu with a series of commands to access the SPI Flash. These commands can be used either to read, write, or erase the SPI flash.

## 23.1.1 Prepare the Demo

- 1. Connect a RS232 UART port to PC.
- 2. Open a serial terminal with these settings:
  - 115200 baud rate
  - 8 data bits
  - No parity
  - One stop bit
  - No flow control
- 3. Download the program to the target board.
- 4. Either press the reset button on your board or launch the debugger in your IDE to begin running the demo.

For more detailed instructions, see a Kinetis SDK User's Guide for your board.

#### 23.1.2 Run the demo

```
***SPI Flash Demo***

1 - Erase entire chip
2 - Erase sectors
3 - Erase block
4 - Program one page with pattern (0x5a) and verify
5 - Read byte
Please enter your choice (1-5):
```

You can select the command you want.

### 23.1.2.1 1. Erase the entire chip

This command erase the entire SPI flash.

```
Please enter your choice (1-5): 1 Erase OK!
```

Freescale Semiconductor 55

#### Overview

### 23.1.2.2 2. Erase sectors

This command erase the sectors specified by user. The input sector address must be HEX, and aligned with 4KB sector size. The input sector erase length must be multi of 4KB.

```
Please enter your choice (1-5): 2

Input the sector address(HEX), 0x1000

Input the sector length:4096

Erase OK!
```

#### 23.1.2.3 3. Erase one block

This command erase one block specified by user. The input block address must be HEX, and aligned with 32KB or 64KB block size.

```
Input the block address(HEX), 0x8000
1. 32K block size
2. 64K block size
Select the block size:1
Erase OK!
```

## 23.1.2.4 4. Programe one page and read out to verify

This command program one page (256B) with the value 0x5A, and then read out it to verify the program result. The input block address must be HEX, and aligned with 32KB or 64KB block size.

```
Please enter your choice (1-5): 4

Input the program address(HEX), 0x100

Program and verify done!
```

## 23.1.2.5 5. Read out one byte

This command read one byte from the address specified by user. The input read address must be HEX.

```
Please enter your choice (1-5): 5

Input the read address(HEX), 0x100
0x100 = 0x5a
```
